Resumemk

Resumemk is a simple resume builder written in Rust. Keep you mind this project uses headless chrome to generate the pdf. So you need to have chrome/chromium installed on your machine.

Self hosting

You can self host this project by using docker. steps:
Build the docker image

docker-compose up -d
Open http://localhost:8080 in your browser

Build

This project comes with an http server that serves a basic markdown editor on your browser. If you don't want/need that, you can build the binary without the server feature.
cargo build --release --no-default-features
If you do want the server, you can run build normally.
cargo build --release

Usage

CLI

resumemk build --help

HTTP Server

resumemk serve
Then open http://localhost:8080 in your browser.

TODO

I think the biggest issue this app has is the binary size. Currently, it's around 12MB, and that's mostly because of the headless chrome library. I have to find a way to reduce the binary size, but I'm not sure how.
